EDUCATION

University of Pennsylvania

B.S.E. in Computer Science; GPA: 3.99/4.0

May 2028

Philadelphia, PA

- **Relevant Coursework:** Operating Systems, Databases, Algorithms, Machine Learning, Computer Vision, Big Data Analytics, Scalable Cloud Computing, Computer Systems, Graph Neural Networks, Natural Language Processing.

TECHNICAL SKILLS

Languages: Python, C/C++, Java, OCaml, SQL, JavaScript, TypeScript, HTML/CSS

Frameworks & Tools: React, Next.js, Tailwind CSS, Node.js, Express, PostgreSQL, PyTorch, scikit-learn, NumPy, pandas/polars, Docker, AWS, Apache Spark

EXPERIENCE

Computational Social Science Lab, University of Pennsylvania

Research Assistant – Software Engineering

June 2026 – Present

Philadelphia, PA

- Merged a NOMAD optimization using spatial candidate search and temporal blocking, accelerating radius-based contact estimation by 35.6× (95.7s to 2.69s) on a 500-user synthetic benchmark while preserving identical output.
- Developed and deployed a Next.js/ECharts dashboard that lets researchers compare stop-detection algorithms on shared GPS trajectories, integrating hosted demos and preview media into the NOMAD website for a NetMob conference submission.

Penn Spark

Software Developer – Atelic Travel Client Project

Feb. 2026 – Present

Philadelphia, PA

- Rebuilt Atelic's public marketing site through Penn Spark, translating product designs into reusable React/Tailwind pages for mobile and desktop while directing users to App Store downloads and Formspre- backed lead capture.

University of Pittsburgh

Research Intern

Aug. 2023 – Present

Pittsburgh, PA

- First-authored a manuscript submitted to *Nature Communications* evaluating AlphaFold 3 robustness, generalization, and binding-affinity correlation across 2,000+ wild-type, mutant, and chimeric protein-peptide predictions.
- Developed AF3 evaluation pipelines for mutation generation and ligand-swapping cross-modeling, using DockQ/RMSD and interface pLDDT/PAE to test structural robustness and correlation with experimental $\Delta\Delta G$.

PROJECTS

PennOS | C, Operating Systems, File Systems

May 2026

- Implemented a Unix-like operating system in C with preemptive priority scheduling, process lifecycle management, job control, terminal signal handling, and POSIX-style shell execution.
- Integrated a custom FAT-style file system that enforces permissions and single-writer access, exposing POSIX-style open/read/write/unlink operations through kernel-managed file descriptors.

Anime Recommendation Query Engine | React, Node.js, PostgreSQL, AWS RDS

May 2026

- Built a React/Express recommendation and analytics app over 31M+ user-anime interactions, backed by PostgreSQL on AWS RDS with search, filtering, and co-viewer queries.
- Reduced representative recommendation latency from ~35s to ~50ms by profiling slow joins and applying indexes, materialized views, query restructuring, and Express API caching.

Distributed Social Graph Engine | Apache Spark, AWS EMR, DynamoDB

Dec. 2025

- Implemented weighted graph adsorption on Spark/EMR over friendship, interest, and article-engagement data from DynamoDB, materializing personalized news recommendations through iterative label propagation.
- Decoupled cluster computation from interactive requests by submitting jobs through Apache Livy, polling completion asynchronously, and refreshing feeds after Spark persisted recommendation results.

LeetLoop | Next.js, TypeScript, Supabase, PostgreSQL

July 2026

- Designed a deterministic scheduler that separates ideal spaced-repetition dates from capacity-constrained daily plans, balances review collisions without leapfrogging older work, and preserves assignments across replans.
- Implemented optimistic client state with serialized, diff-based Supabase writes and per-user PostgreSQL row-level security, keeping interactions responsive while preserving mutation order and account isolation.
